Provides unique synthesis of various modeling methodologies used to aid planning and operational decision making, for academic researchers and professionals. William S. Kroger (April 14, 1906 - December 4, 1994) was an American medical doctor who pioneered the use of hypnosis in medicine and was co-founder and founder of medical societies and academies dedicated to furthering psychosomatic medicine and medical hypnosis. Though he was trained as a gynecologist/obstetrician, his contributions to the medical field cut across disciplines and specialties in the medical field, including psychiatry, psychosomatic illness and treatment, endocrinology, neurobiology and bioengineering as well as his own specialty of gynecology and obstetrics. He is the author of the medical textbook, *Clinical and Experimental Hypnosis*, considered to be a classic instructional aid in the use of hypnosis in medical settings, as well as co-authoring *Psychosomatic Gynecology, Including Problems of Obstetrical Care and Hypnosis and Behavior Modification: Imagery Conditioning*, among others. Sosh is an approach to social skills based on a decade of work with children, adolescents, and young adults who struggle with social difficulties. The Sosh framework divides social functioning into five areas essential to social skills development and success: Relate (Connect with Others), Relax (Reduce Stress), Regulate

(Manage Behaviors), Reason (Think it Through) and Recognize (Understand Feelings). A selection of annotated references to unclassified reports and journal articles that were introduced into the NASA scientific and technical information system and announced in Scientific and technical aerospace reports (STAR) and International Aerospace Abstracts (IAA). Containing more than 2,100 original mental imagery exercises drawn from the work of the great 20th-century spiritual master and healer Colette Aboulker-Muscat, this manual of spiritual teaching and rich treasury of powerful healing images can be used as a daily source of inspiration, transformation, and healing.

Annotation Valeria Sobol probes beyond the perception of "love and death" as a constant theme of eighteenth- and nineteenth-century Russian literature, examining what underlies the stereotype about the destructive power of romantic love and why Russian writers so willingly employ this cliché. Using this defamiliarized approach, Sobol investigates the medical and cultural traditions that give shape to the convention and considers the philosophical implications of this familiar motif. In *Febris Erotica*, Sobol argues that Russian writers were deeply preoccupied with the nature of the relationship between mind and body and were persistent in their use of lovesickness not simply as a traditional theme but as a way to address pressing philosophical, ethical, and ideological concerns through a recognizable literary trope. Finally, Sobol offers a short history of the topos of lovesickness in Western literature and medicine and examines its appropriation in early

modern Russia. Valeria Sobol is assistant professor of Slavic languages and literatures at the University of Illinois. Graded Motor Imagery is a complex series of treatments including graded left/right judgement exercises, imagined movements and use of mirrors targeting neuropathic pain problems. The focus of this collection is on processes of cultural communication in late medieval/early modern European society and the part which these resources play in shaping community and fashioning self and group identity. This monograph sets forth a theoretical basis for advocating a program of disciplinary arts education as an integral part of general education from kindergarten through grade 12. The title, "The Role of Imagery in Learning," indicates the centrality of aesthetic perception of images. To make the case, it is necessary to show by analysis, argument, and example the role that images in general and those portrayed in the arts in particular play in: (1) everyday experience and (2) the formation of the educated mind. The roles of imagery in the learning of skills (especially the skills of language), concepts, attitudes, and values are examined to identify points at which the sensory image becomes crucial for understanding. Throughout the essay runs a thread that might be called "the uses of knowledge or schooling." The argument holds that the arts as learned in general education are used associatively and interpretively, rather than replicatively or applicatively. Their function is to enrich the allusionary base, the store of images, and concepts that qualify for inclusion in general education. Although this is not

discussed in detail, the theory implies that discipline-based arts education as part of general education must be teachable by the classroom teacher with the same degree of competence demanded by the teaching of other required subjects. This requirement raises the question as to whether classroom teachers can achieve this and calls for a method of preservice and in-service training that would enable them to do so. (Author/AA)

The American Southwest has been variously celebrated as a place of enormous beauty with a sense of deep historical roots and condemned as a place without any past or, indeed, an inhabitable present. The extremes of southwestern life modern and traditional, urban and rural, tame and wild, ugly and beautiful, polluted and pure - pervade the region. How America has come to view the Southwest and its distinctive images - and why it has formed these views - is the subject of this intriguing interdisciplinary book. The "great debate" in cognitive science today is about the nature of mental images. One side says images are basically pictures in the head. The other side says they are like the symbol structures in computers. If the picture-in-the-head theorists are right, then computers will never be able to think like people. This book contains the most intelligible and incisive articles in the debate, articles by cognitive psychologists, computer scientists and philosophers. The most exciting imagery phenomena are described, phenomena that indicate that mental images can be rotated and scanned, that smaller images are harder to see than larger ones, that when mental images are made

larger they eventually overflow, that the "screen" they overflow from has a determinable shape (elliptical), and that this "screen" subtends a determinate visual angle, the angle of vision of the mind's eye. Such experiments cry out for explanation. If images are pictures in the head, who (or what) looks at them? Why haven't brain scientists found them? Such questions are the subject of the great debate. IMAGERY is an excellent choice for courses in cognitive psychology, perception: artificial intelligence, computer science; philosophy of mind, of psychology and of science; minds and machines, science and society. Contributors include: Roger Brown and Richard Herrnstein (on the work of Roger N. Shepard), Daniel Dennett, Jerry Fodor, Robert Schwartz, Stephen Kosslyn, Steven Pinker, George Smith, Steven Shwartz, and Zenon Pylyshyn, 1. Imagery previewed -- 2. Philosophical and methodological problems -- 3. Consciousness -- 4. Types of imagery -- 5. Individual differences and dimensions of the image -- 6. Theories of imagery -- 7. Images and words: evidence for separate processing systems -- 8. Properties of the imagery system -- 9. Uses and functions of imagery -- 10. Imagery and memory: voluntary images -- 11. This text reflects the interdisciplinary nature of GIS research and includes coverage of such themes as: virtual GIS; spatial analysis; artificial intelligence; spatial agents and fuzzy systems; and space-time GIS and GIS applications.
